

Abstract of the invention

This invention relates to a method for the production of a producing a three-dimensional preform from textile starting materials such as fibers, fiber bundles or tapes. The textile starting materials are laid in a plane in a two-dimensional manner, whereby the orientation of the fibers and the geometry of the two-dimensional bonded fabric have been determined from the three-dimensional target form by means of back-calculation. The three-dimensional target form is produced by shaping/draping the two-dimensional bonded fabric.
